**2'-O-AMINOETHYLOXYETHYL-MODIFIED  
OLIGONUCLEOTIDES**

**5 RELATED APPLICATION DATA**

This patent application is a continuation-in-part of Application Serial No. 09/130,566, filed August 7, 1998, the contents of which are incorporated herein by reference.

**FIELD OF THE INVENTION**

10           The present invention relates to nucleosidic monomers and oligomeric compounds incorporating such nucleosidic monomers, and methods of using such oligomeric compounds. The oligomeric compounds of the invention are useful for therapeutic and investigative purposes. More  
15 specifically, the present invention is directed to the use of oligomeric compounds having 2'-O-modifications that will increase their affinity and nuclease resistance.

**BACKGROUND OF THE INVENTION**

20           It is well known that most of the bodily states in mammals, including most disease states, are affected by proteins. Classical therapeutic modes have generally focused on interactions with such proteins in an effort to moderate their disease-causing or disease-potentiating

- 2 -

functions. Recently, however, attempts have been made to moderate the actual production of such proteins by interactions with molecules that direct their synthesis, such as intracellular RNA. By interfering with the  
5 production of proteins, maximum therapeutic effect and minimal side effects may be realized. It is the general object of such therapeutic approaches to interfere with or otherwise modulate gene expression leading to undesired protein formation.

10 One method for inhibiting specific gene expression is the use of oligonucleotides. Oligonucleotides are now accepted as therapeutic agents with great promise, and are known to hybridize to single-stranded DNA or RNA molecules. Hybridization is the sequence-specific base pair hydrogen  
15 bonding of nucleobases of the oligonucleotide to the nucleobases of the target DNA or RNA molecule. Such nucleobase pairs are said to be complementary to one another. The concept of inhibiting gene expression through the use of sequence-specific binding of oligonucleotides to  
20 target RNA sequences, also known as antisense inhibition, has been demonstrated in a variety of systems, including living cells (see, e.g., Wagner et al., Science (1993) 260: 1510-1513; Milligan et al., J. Med. Chem., (1993) 36:1923-37; Uhlmann et al., Chem. Reviews, (1990) 90:543-584; Stein  
25 et al., Cancer Res., (1988) 48:2659-2668).

The events that provide the disruption of the nucleic acid function by antisense oligonucleotides (Cohen in *Oligonucleotides: Antisense Inhibitors of Gene Expression*, (1989) CRC Press, Inc., Boca Raton, FL) are  
30 thought to be of two types. The first, hybridization arrest, denotes the terminating event in which the oligonucleotide inhibitor binds to the target nucleic acid and thus prevents, by simple steric hindrance, the binding of essential proteins, most often ribosomes, to the nucleic  
35 acid. Methyl phosphonate oligonucleotides: Miller, P.S. and

- 3 -

Ts'O, P.O.P. (1987) *Anti-Cancer Drug Design*, 2:117-128, and  $\alpha$ -anomer oligonucleotides are the two most extensively studied antisense agents which are thought to disrupt nucleic acid function by hybridization arrest.

5           The second type of terminating event for antisense oligonucleotides involves the enzymatic cleavage of the targeted RNA by intracellular RNase H. A 2'-deoxyribo-furanosyl oligonucleotide or oligonucleotide analog hybridizes with the targeted RNA and this duplex activates  
10 the RNase H enzyme to cleave the RNA strand, thus destroying the normal function of the RNA. Phosphorothioate oligonucleotides are the most prominent example of an antisense agent that operates by this type of antisense terminating event.

15           Oligonucleotides may also bind to duplex nucleic acids to form triplex complexes in a sequence specific manner via Hoogsteen base pairing (Beal et al., *Science*, (1991) 251:1360-1363; Young et al., *Proc. Natl. Acad. Sci.* (1991) 88:10023-10026). Both antisense and triple helix  
20 therapeutic strategies are directed towards nucleic acid sequences that are involved in or responsible for establishing or maintaining disease conditions. Such target nucleic acid sequences may be found in the genomes of pathogenic organisms including bacteria, yeasts, fungi,  
25 protozoa, parasites, viruses, or may be endogenous in nature. By hybridizing to and modifying the expression of a gene important for the establishment, maintenance or elimination of a disease condition, the corresponding condition may be cured, prevented or ameliorated.

30           In determining the extent of hybridization of an oligonucleotide to a complementary nucleic acid, the relative ability of an oligonucleotide to bind to the complementary nucleic acid may be compared by determining the melting temperature of a particular hybridization  
35 complex. The melting temperature ( $T_m$ ), a characteristic

- 4 -

physical property of double helices, denotes the temperature (in degrees centigrade) at which 50% helical (hybridized) versus coil (unhybridized) forms are present.  $T_m$  is measured by using the UV spectrum to determine the formation and  
5 breakdown (melting) of the hybridization complex. Base stacking, which occurs during hybridization, is accompanied by a reduction in UV absorption (hypochromicity). Consequently, a reduction in UV absorption indicates a higher  $T_m$ . The higher the  $T_m$ , the greater the strength of  
10 the bonds between the strands.

Oligonucleotides may also be of therapeutic value when they bind to non-nucleic acid biomolecules such as intracellular or extracellular polypeptides, proteins, or enzymes. Such oligonucleotides are often referred to as  
15 "aptamers" and they typically bind to and interfere with the function of protein targets (Griffin, et al., *Blood*, (1993), 81:3271-3276; Bock, et al., *Nature*, (1992) 355: 564-566).

Oligonucleotides and their analogs (oligomeric compounds) have been developed and used for diagnostic  
20 purposes, therapeutic applications and as research reagents. For use as therapeutics, oligonucleotides preferably are transported across cell membranes or be taken up by cells, and appropriately hybridize to target DNA or RNA. These functions are believed to depend on the initial stability of  
25 the oligonucleotides toward nuclease degradation. A deficiency of unmodified oligonucleotides which affects their hybridization potential with target DNA or RNA for therapeutic purposes is their degradation by a variety of ubiquitous intracellular and extracellular nucleolytic  
30 enzymes referred to as nucleases. For oligonucleotides to be useful as therapeutics or diagnostics, the oligonucleotides should demonstrate enhanced binding affinity to complementary target nucleic acids, and preferably be reasonably stable to nucleases and resist  
35 degradation. For a non-cellular use such as a research

- 5 -

reagent, oligonucleotides need not necessarily possess nuclease stability.

A number of chemical modifications have been introduced into oligonucleotides to increase their binding  
5 affinity to target DNA or RNA and resist nuclease degradation. Modifications have been made, for example, to the phosphate backbone to increase the resistance to nucleases. These modifications include use of linkages such as methyl phosphonates, phosphorothioates and phosphoro-  
10 dithioates, and the use of modified sugar moieties such as 2'-O-alkyl ribose. Other oligonucleotide modifications include those made to modulate uptake and cellular distribution. A number of modifications that dramatically alter the nature of the internucleotide linkage have also  
15 been reported in the literature. These include non-phosphorus linkages, peptide nucleic acids (PNA's) and 2'-5' linkages. Another modification to oligonucleotides, usually for diagnostic and research applications, is labeling with non-isotopic labels, e.g., fluorescein, biotin, digoxigenin,  
20 alkaline phosphatase, or other reporter molecules.

Over the last ten years, a variety of synthetic modifications have been proposed to increase nuclease resistance, or to enhance the affinity of the antisense strand for its target mRNA (Crooke et al., *Med. Res. Rev.*,  
25 **1996**, 16, 319-344; De Mesmaeker et al., *Acc. Chem. Res.*, **1995**, 28, 366-374). A variety of modified phosphorus-containing linkages have been studied as replacements for the natural, readily cleaved phosphodiester linkage in oligonucleotides. In general, most of them, such as the  
30 phosphorothioate, phosphoramidates, phosphonates and phosphorodithioates all result in oligonucleotides with reduced binding to complementary targets and decreased hybrid stability.

RNA exists in what has been termed "A Form"  
35 geometry while DNA exists in "B Form" geometry. In general,

- 6 -

RNA:RNA duplexes are more stable, or have higher melting temperatures ( $T_m$ ) than DNA:DNA duplexes (Sanger et al., *Principles of Nucleic Acid Structure*, 1984, Springer-Verlag; New York, NY.; Lesnik et al., *Biochemistry*, 1995, 34, 10807-  
5 10815; Conte et al., *Nucleic Acids Res.*, 1997, 25, 2627-2634). The increased stability of RNA has been attributed to several structural features, most notably the improved base stacking interactions that result from an A-form geometry (Searle et al., *Nucleic Acids Res.*, 1993, 21, 2051-  
10 2056). The presence of the 2' hydroxyl in RNA biases the sugar toward a C3' endo pucker, i.e., also designated as Northern pucker, which causes the duplex to favor the A-form geometry. On the other hand, deoxy nucleic acids prefer a C2' endo sugar pucker, i.e., also known as Southern pucker,  
15 which is thought to impart a less stable B-form geometry (Sanger, W. (1984) *Principles of Nucleic Acid Structure*, Springer-Verlag, New York, NY). In addition, the 2' hydroxyl groups of RNA can form a network of water mediated hydrogen bonds that help stabilize the RNA duplex (Egli et  
20 al., *Biochemistry*, 1996, 35, 8489-8494).

DNA:RNA hybrid duplexes, however, are usually less stable than pure RNA:RNA duplexes and, depending on their sequence, may be either more or less stable than DNA:DNA duplexes (Searle et al., *Nucleic Acids Res.*, 1993, 21, 2051-  
25 2056). The structure of a hybrid duplex is intermediate between A- and B-form geometries, which may result in poor stacking interactions (Lane et al., *Eur. J. Biochem.*, 1993, 215, 297-306; Fedoroff et al., *J. Mol. Biol.*, 1993, 233, 509-523; Gonzalez et al., *Biochemistry*, 1995, 34, 4969-4982;  
30 Horton et al., *J. Mol. Biol.*, 1996, 264, 521-533). The stability of a DNA:RNA hybrid a significant aspect of antisense therapies, as the proposed mechanism requires the binding of a modified DNA strand to a mRNA strand. Ideally, the antisense DNA should have a very high binding affinity

- 7 -

with the mRNA. Otherwise, the desired interaction between the DNA and target mRNA strand will occur infrequently, thereby decreasing the efficacy of the antisense oligonucleotide.

5                   One synthetic 2'-modification that imparts increased nuclease resistance and a very high binding affinity to nucleotides is the 2'-methoxyethoxy (MOE, 2'-OCH<sub>2</sub>CH<sub>2</sub>OCH<sub>3</sub>) side chain (Baker et al., *J. Biol. Chem.*, **1997**, 272, 11944-12000; Freier et al., *Nucleic Acids Res.*, **1997**,  
10 25, 4429-4443). One of the immediate advantages of the MOE substitution is the improvement in binding affinity, which is greater than many similar 2' modifications such as O-methyl, O-propyl, and O-aminopropyl (Freier and Altmann, *Nucleic Acids Research*, (1997) 25:4429-4443). 2'-O-  
15 Methoxyethyl-substituted also have been shown to be antisense inhibitors of gene expression with promising features for *in vivo* use (Martin, P., *Helv. Chim. Acta*, **1995**, 78, 486-504; Altmann et al., *Chimia*, **1996**, 50, 168-176; Altmann et al., *Biochem. Soc. Trans.*, **1996**, 24, 630-  
20 637; and Altmann et al., *Nucleosides Nucleotides*, 1997, **16**, 917-926). Relative to DNA, they display improved RNA affinity and higher nuclease resistance. Chimeric oligonucleotides with 2'-O-methoxyethyl-ribonucleoside wings and a central DNA-phosphorothioate window also have been shown  
25 to effectively reduce the growth of tumors in animal models at low doses. MOE substituted oligonucleotides have shown outstanding promise as antisense agents in several disease states. One such MOE substituted oligonucleotide is presently being investigated in clinical trials for the  
30 treatment of CMV retinitis.

Although the known modifications to oligonucleotides, including the use of the 2'-O-methoxyethyl modification, have contributed to the development of oligonucleotides for various uses, there still exists a need in the art for

- 8 -

further modifications that will impart enhanced hybrid binding affinity and/or increased nuclease resistance to oligonucleotides and their analogs.

## 5 SUMMARY OF THE INVENTION

The present invention provides oligomeric compounds having at least one 2'-O-CH<sub>2</sub>CH<sub>2</sub>-O-CH<sub>2</sub>CH<sub>2</sub>-N(R<sub>1</sub>)(R<sub>2</sub>) modified nucleoside. Preferred oligomeric compounds of the invention are those that include at least one nucleoside of the

10 formula:

wherein

Bx is a heterocyclic base;

each R<sub>1</sub> and R<sub>2</sub> is, independently, H, a nitrogen  
 15 protecting group, substituted or unsubstituted C<sub>1</sub>-C<sub>10</sub> alkyl, substituted or unsubstituted C<sub>2</sub>-C<sub>10</sub> alkenyl, substituted or unsubstituted C<sub>2</sub>-C<sub>10</sub> alkynyl, wherein said substitution is OR<sub>3</sub>, SR<sub>3</sub>, NH<sub>3</sub><sup>+</sup>, N(R<sub>3</sub>)(R<sub>4</sub>), guanidino or acyl where said acyl is an acid, amide or an ester;

20 or R<sub>1</sub> and R<sub>2</sub>, together, are a nitrogen protecting group or are joined in a ring structure that optionally includes an additional heteroatom selected from N and O; and

each R<sub>3</sub> and R<sub>4</sub> is, independently, H, C<sub>1</sub>-C<sub>10</sub> alkyl, a nitrogen protecting group, or R<sub>3</sub> and R<sub>4</sub>, together, are a  
 25 nitrogen protecting group;

or R<sub>3</sub> and R<sub>4</sub> are joined in a ring structure that optionally includes an additional heteroatom selected from N and O.

- 9 -

In one embodiment  $R_1$  is H,  $C_1$ - $C_{10}$  alkyl or  $C_1$ - $C_{10}$  substituted alkyl and  $R_2$  is  $C_1$ - $C_{10}$  substituted alkyl. In another embodiment  $R_1$  is  $C_1$ - $C_{10}$  alkyl. In a further embodiment  $R_2$  is  $C_1$ - $C_{10}$  substituted alkyl and the substituent  
 5 is  $NH_3^+$  or  $N(R_3)(R_4)$ . In another embodiment  $R_1$  and  $R_2$  are both  $C_1$ - $C_{10}$  substituted alkyl with preferred substituents independently selected from  $NH_3^+$  and  $N(R_3)(R_4)$ . In yet a further embodiment both  $R_1$  and  $R_2$  are  $C_1$ - $C_{10}$  alkyl.

In one embodiment  $R_1$  and  $R_2$  are joined in a ring  
 10 structure that can include at least one heteroatom selected from N and O. Preferred ring structures are imidazole, piperidine, morpholine or a substituted piperazine with a preferred substituent being  $C_1$ - $C_{12}$  alkyl.

In one embodiment the heterocyclic base is a purine or  
 15 a pyrimidine with preferred heterocyclic bases being adenine, cytosine, 5-methylcytosine, thymine, uracil, guanine or 2-aminoadenine.

In one embodiment the oligomeric compound comprises from about 5 to about 50 nucleosides. In a preferred  
 20 embodiment the oligomeric compound comprises from about 8 to about 30 nucleosides with a preferred range from about 15 to about 25 nucleosides.

The present invention also includes nucleosidic compounds of the formula:

25

wherein:

Bx is a heterocyclic base;

$T_1$  and  $T_2$ , independently, are OH, a protected hydroxyl,  
 30 an activated phosphorus group, a reactive group for forming

- 10 -

an internucleotide linkage, a nucleoside, a nucleotide, an oligonucleoside an oligonucleotide or a linkage to a solid support;

each  $R_1$  and  $R_2$  is, independently, H, a nitrogen protecting group, substituted or unsubstituted  $C_1$ - $C_{10}$  alkyl, substituted or unsubstituted  $C_2$ - $C_{10}$  alkenyl, substituted or unsubstituted  $C_2$ - $C_{10}$  alkynyl, wherein said substitution is  $OR_3$ ,  $SR_3$ ,  $NH_3^+$ ,  $N(R_3)(R_4)$ , guanidino or acyl where said acyl is an acid, amide or an ester;

or  $R_1$  and  $R_2$ , together, are a nitrogen protecting group or are joined in a ring structure that optionally includes an additional heteroatom selected from N and O; and

each  $R_3$  and  $R_4$  is, independently, H,  $C_1$ - $C_{10}$  alkyl, a nitrogen protecting group, or  $R_3$  and  $R_4$ , together, are a nitrogen protecting group;

or  $R_3$  and  $R_4$  are joined in a ring structure that optionally includes an additional heteroatom selected from N and O.

In one embodiment  $R_1$  is H,  $C_1$ - $C_{10}$  alkyl or  $C_1$ - $C_{10}$  substituted alkyl and  $R_2$  is  $C_1$ - $C_{10}$  substituted alkyl. In another embodiment  $R_1$  is  $C_1$ - $C_{10}$  alkyl. In a further embodiment  $R_2$  is  $C_1$ - $C_{10}$  substituted alkyl and the substituent is  $NH_3^+$  or  $N(R_3)(R_4)$ . In another embodiment  $R_1$  and  $R_2$  are both  $C_1$ - $C_{10}$  substituted alkyl with preferred substituents independently selected from  $NH_3^+$  and  $N(R_3)(R_4)$ . In yet a further embodiment both  $R_1$  and  $R_2$  are  $C_1$ - $C_{10}$  alkyl.

In one embodiment  $R_1$  and  $R_2$  are joined in a ring structure that can include at least one heteroatom selected from N and O. Preferred ring structures are imidazole, piperidine, morpholine or a substituted piperazine with a preferred substituent being  $C_1$ - $C_{12}$  alkyl.

In one embodiment the heterocyclic base is a purine or a pyrimidine with preferred heterocyclic bases being adenine, cytosine, 5-methylcytosine, thymine, uracil, guanine or 2-aminoadenine.

- 11 -

In one embodiment  $T_1$  is a hydroxyl protecting group. In another embodiment  $T_2$  is an activated phosphorus group or a connection to a solid support. A preferred solid support material is microparticles. With CPG being a more preferred  
5 solid support material.

#### DETAILED DESCRIPTION OF THE INVENTION

The present invention is directed to novel 2'-O-modified nucleosidic monomers and to oligomeric compounds incorporating these novel 2'-O-modified nucleosidic  
10 monomers. These modifications have certain desirable properties that contribute toward increases in binding affinity and/or nuclease resistance.

There are a number of items to consider when designing oligomeric compounds having enhanced binding affinities.  
15 One effective approach to constructing oligomeric compounds with very high RNA binding affinity relates to the combination of two or more different types of modifications, each of which contributes favorably to various factors that might be important for binding affinity.

20 Freier and Altmann, *Nucleic Acids Research*, (1997) 25:4429-4443, recently published a study on the influence of structural modifications of oligonucleotides on the stability of their duplexes with target RNA. In this study, the authors reviewed a series of oligonucleotides containing  
25 more than 200 different modifications that had been synthesized and assessed for their hybridization affinity and  $T_m$ . Sugar modifications studied included substitutions on the 2'-position of the sugar, 3'-substitution, replacement of the 4'-oxygen, the use of bicyclic sugars,  
30 and four member ring replacements. Several heterocyclic base modifications were also studied including substitutions at the 5, or 6 position of thymine, modifications of pyrimidine heterocycles and modifications of purine heterocycles. Numerous backbone modifications were also

- 12 -

investigated including backbones bearing phosphorus, backbones that did not bear a phosphorus atom, and backbones that were neutral.

Four general approaches potentially may be used to  
5 improve hybridization of oligonucleotides to RNA targets. These include: preorganization of the sugars and phosphates of the oligodeoxynucleotide strand into conformations favorable for hybrid formation, improving stacking of nucleobases by the addition of polarizable groups to the  
10 heterocycle bases of the nucleosidic monomers of the oligonucleotide, increasing the number of H-bonds available for A-U pairing, and neutralization of backbone charge to facilitate removing undesirable repulsive interactions. This invention principally employs the first of these,  
15 preorganization of the sugars and phosphates of the oligodeoxynucleotide strand into conformations favorable for hybrid formation, and can be used in combination with the other three approaches.

Sugars in DNA:RNA hybrid duplexes frequently adopt a  
20 C3' endo conformation. Thus, modifications that shift the conformational equilibrium of the sugar moieties in the single strand toward this conformation should preorganize the antisense strand for binding to RNA. Of the several sugar modifications that have been reported and studied in  
25 the literature, the incorporation of electronegative substituents such as 2'-fluoro or 2'-alkoxy shift the sugar conformation towards the 3' endo (northern) pucker conformation. This pucker conformation further assisted in increasing the T<sub>m</sub> of the oligonucleotide with its target.

30 There is a clear correlation between substituent size at the 2'-position and duplex stability. Incorporation of alkyl substituents at the 2'-position typically leads to a significant decrease in binding affinity. Thus, small alkoxy groups generally are very favorable while larger  
35 alkoxy groups at the 2'-position generally are unfavorable.

- 13 -

However, if the 2'-substituent contained an ethylene glycol motif, then a strong improvement in binding affinity to the target RNA is observed.

The high binding affinity resulting from 2'-  
5 substitution has been partially attributed to the 2'-  
substitution causing a C3' *endo* sugar pucker which in turn  
may give the oligomer a favorable A-form like geometry.  
This is a reasonable hypothesis since substitution at the 2'  
10 position by a variety of electronegative groups (such as  
fluoro and O-alkyl chains) has been demonstrated to cause  
C3' *endo* sugar puckering (De Mesmaeker et al., *Acc. Chem.*  
*Res.*, **1995**, 28, 366-374; Lesnik et al., *Biochemistry*, **1993**,  
32, 7832-7838).

In addition, for 2'-substituents containing an ethylene  
15 glycol motif, a *gauche* interaction between the oxygen atoms  
around the O-C-C-O torsion of the side chain may have a  
stabilizing effect on the duplex (Freier et al., *Nucleic*  
*Acids Research*, (1997) 25:4429-4442). Such *gauche*  
interactions have been observed experimentally for a number  
20 of years (Wolfe et al., *Acc. Chem. Res.*, **1972**, 5, 102; Abe  
et al., *J. Am. Chem. Soc.*, **1976**, 98, 468). This *gauche*  
effect may result in a configuration of the side chain that  
is favorable for duplex formation. The exact nature of this  
stabilizing configuration has not yet been explained. While  
25 we do not want to be bound by theory, it may be that holding  
the O-C-C-O torsion in a single *gauche* configuration, rather  
than a more random distribution seen in an alkyl side chain,  
provides an entropic advantage for duplex formation.

The present invention has 2' side chain having the  
30 formula: 2'-OCH<sub>2</sub>CH<sub>2</sub>OCH<sub>2</sub>CH<sub>2</sub>N(R<sub>1</sub>)(R<sub>2</sub>), where R<sub>1</sub> and R<sub>2</sub> can each be  
alkyl or substituted alkyl groups which gives a tertiary  
amine capable of being protonated. When R<sub>1</sub> and R<sub>2</sub> are both  
methyl groups the pKa of the side chain is 9.0 to 10.0  
(aliphatic saturated 3° amine). This tertiary amine is

- 14 -

expected to be protonated at physiological pH (7.0), and in endosomes and lysosomes (pH 5.0). The resulting positive charge should improve the biostability of the drug by either inhibiting the nuclease from binding to the oligonucleotide  
5 or displacing the metal ions needed for the nucleases to carry on their function (Beese et al., *EMBO J.*, **1991**, 10, 25-33; and Brautigam et al., *J. Mol. Bio.*, **1998**, 277, 363-377).

As used herein, the term oligonucleoside includes  
10 oligomers or polymers containing two or more nucleoside subunits having a non-phosphorous linking moiety. Oligonucleosides according to the invention are monomeric subunits having a ribofuranose moiety attached to a heterocyclic base via a glycosyl bond. An oligo-  
15 nucleotide/nucleoside for the purposes of the present invention is a mixed backbone oligomer having at least two nucleosides covalently bound by a non-phosphate linkage and at least one phosphorous containing covalent bond with a nucleotide, and wherein at least one of the monomeric  
20 nucleotide or nucleoside units is a 2'-O-substituted compound prepared using the process of the present invention. An oligo-nucleotide/nucleoside can additionally have a plurality of nucleotides and nucleosides coupled through phosphorous containing and/or non-phosphorous  
25 containing linkages.

In the context of this invention, the term "oligomeric compound" refers to a plurality of nucleosides joined together in a specific sequence from naturally and non-naturally occurring nucleosides. The term includes  
30 oligonucleotides, oligonucleotide analogs, oligonucleosides having non-phosphorus containing internucleoside linkages and chimeric oligomeric compounds having mixed internucleoside linkages which can include all phosphorus or phosphorus and non-phosphorus containing internucleoside  
35 linkages. Each of the oligomeric compounds of the invention

- 15 -

have at least one modified nucleoside where the modification is an aminoxy compound of the invention. Preferred nucleosides of the invention are joined through a sugar moiety via phosphorus linkages, and include adenine, 5 guanine, adenine, cytosine, uracil, thymine, xanthine, hypoxanthine, 2-aminoadenine, 6-methyl, 2-propyl and other alkyl adenines, 5-halo uracil, 5-halo cytosine, 6-aza uracil, 6-aza cytosine and 6-aza thymine, pseudo uracil, 4-thiouracil, 8-halo adenine, 8-aminoadenine, 8-thiol adenine, 10 8-thiolalkyl adenines, 8-hydroxyl adenine and other 8-substituted adenines, 8-halo guanines, 8-amino guanine, 8-thiol guanine, 8-thiolalkyl guanines, 8-hydroxyl guanine and other 8-substituted guanines, other aza and deaza uracils, other aza and deaza thymidines, other aza and deaza 15 cytosines, other aza and deaza adenines, other aza and deaza guanines, 5-trifluoromethyl uracil and 5-trifluoro cytosine.

phosphorus containing linkages

phosphorodithioate (-O-P(S)(S)-O-);  
phosphorothioate (-O-P(S)(O)-O-);  
20 phosphoramidate (-O-P(O)(NJ)-O-);  
phosphonate (-O-P(J)(O)-O-);  
phosphotriesters (-O-P(O)(J)(O)-O-);  
phosphoramidate (-O-P(O)(NJ)-S-);  
thionoalkylphosphonate (-O-P(S)(J)-O-);  
25 thionoalkylphosphotriester (-O-P(O)(OJ)-S-);  
boranophosphate (-R<sup>5</sup>-P(O)(O)-J-);

non-phosphorus containing linkages

thiodiester (-O-C(O)-S-);  
thionocarbamate (-O-C(O)(NJ)-S-);  
30 siloxane (-O-Si(J)<sub>2</sub>-O-);  
carbamate (-O-C(O)-NH- and -NH-C(O)-O-);  
sulfamate (-O-S(O)(O)-N- and -N-S(O)(O)-N-);  
morpholino sulfamide (-O-S(O)(N(morpholino))-);  
sulfonamide (-O-SO<sub>2</sub>-NH-);  
35 sulfide (-CH<sub>2</sub>-S-CH<sub>2</sub>-);

- 16 -

sulfonate (-O-SO<sub>2</sub>-CH<sub>2</sub>-);N,N'-dimethylhydrazine (-CH<sub>2</sub>-N(CH<sub>3</sub>)-N(CH<sub>3</sub>)-);thioformacetal (-S-CH<sub>2</sub>-O-);formacetal (-O-CH<sub>2</sub>-O-);5 thioketal (-S-C(J)<sub>2</sub>-O-); andketal (-O-C(J)<sub>2</sub>-O-);amine (-NH-CH<sub>2</sub>-CH<sub>2</sub>-);hydroxylamine (-CH<sub>2</sub>-N(J)-O-);

hydroxyimine (-CH=N-O-); and

10 hydrazinyl (-CH<sub>2</sub>-N(H)-N(H)-).

where "J" denotes a substituent group which is commonly hydrogen or an alkyl group or a more complicated group that varies from one type of linkage to another.

In addition to linking groups as described above that  
15 involve the modification or substitution of the -O-P-O-  
atoms of a naturally occurring linkage, included within the  
scope of the present invention are linking groups that  
include modification of the 5'-methylene group as well as  
one or more of the -O-P-O- atoms. Linkages of this type are  
20 well documented in the prior art and include without  
limitation the following:

amides (-CH<sub>2</sub>-CH<sub>2</sub>-N(H)-C(O)) and -CH<sub>2</sub>-O-N=CH-; andalkylphosphorus (-C(J)<sub>2</sub>-P(=O)(OJ)-C(J)<sub>2</sub>-C(J)<sub>2</sub>-).

wherein J is as described above.

25 Synthetic schemes for the synthesis of the substitute  
internucleoside linkages described above are disclosed in:

The nucleosidic monomers and oligomeric compounds of the invention can include modified sugars and modified bases (see, e.g., United States Patent 3,687,808 and PCT application PCT/US89/02323). Such oligomeric compounds are best described as being structurally distinguishable from, yet functionally interchangeable with, naturally occurring or synthetic wild type oligonucleotides. Representative modified sugars include carbocyclic or acyclic sugars, sugars having substituent groups at their 2' position, sugars having substituent groups at their 3' position, and sugars having substituents in place of one or more hydrogen atoms of the sugar. Representative modifications are disclosed in International Publication Numbers WO 91/10671, published July 25, 1991, WO 92/02258, published February 20, 1992, WO 92/03568, published March 5, 1992, and United States Patents 5,138,045, 5,218,105, 5,223,618 5,359,044, 5,378,825, 5,386,023, 5,457,191, 5,459,255, 5,489,677, 5,506,351, 5,541,307, 5,543,507, 5,571,902, 5,578,718, 5,587,361, 5,587,469, all assigned to the assignee of this application. The disclosures of each of the above referenced publications are herein incorporated by reference.

Additional modifications may also be made at for example the 3' position of the sugar on the 3' terminal nucleosidic monomer and the 5' position of the 5' terminal nucleosidic monomer. In one aspect of the invention

- 18 -

moieties or conjugates which enhance activity, cellular distribution or cellular uptake are chemically linked to one or more positions that are available for modification. Such moieties include but are not limited to lipid moieties such as a cholesterol moiety (Letsinger et al., *Proc. Natl. Acad. Sci. USA*, 1989, 86, 6553), cholic acid (Manoharan et al., *Bioorg. Med. Chem. Lett.*, 1994, 4, 1053), a thioether, e.g., hexyl-S-tritylthiol (Manoharan et al., *Ann. N.Y. Acad. Sci.*, 1992, 660, 306; Manoharan et al., *Bioorg. Med. Chem. Lett.*, 1993, 3, 2765), a thiocholesterol (Oberhauser et al., *Nucl. Acids Res.*, 1992, 20, 533), an aliphatic chain, e.g., dodecandiol or undecyl residues (Saison-Behmoaras et al., *EMBO J.*, 1991, 10, 111; Kabanov et al., *FEBS Lett.*, 1990, 259, 327; Svinarchuk et al., *Biochimie*, 1993, 75, 49), a phospholipid, e.g., di-hexadecyl-rac-glycerol or triethyl-ammonium 1,2-di-O-hexadecyl-rac-glycero-3-H-phosphonate (Manoharan et al., *Tetrahedron Lett.*, 1995, 36, 3651; Shea et al., *Nucl. Acids Res.*, 1990, 18, 3777), a polyamine or a polyethylene glycol chain (Manoharan et al., *Nucleosides & nucleosidic monomers*, 1995, 14, 969), or adamantane acetic acid (Manoharan et al., *Tetrahedron Lett.*, 1995, 36, 3651), a palmityl moiety (Mishra et al., *Biochim. Biophys. Acta*, 1995, 1264, 229), or an octadecylamine or hexylamino-carbonyl-oxycholesterol moiety (Crooke et al., *J. Pharmacol. Exp. Ther.*, 1996, 277, 923).

Representative heterocyclic bases amenable to the present invention include guanine, cytosine, uridine, and thymine, as well as other synthetic and natural nucleobases such as xanthine, hypoxanthine, 2-aminoadenine, 6-methyl and other alkyl derivatives of adenine and guanine, 2-propyl and other alkyl derivatives of adenine and guanine, 5-halo uracil and cytosine, 6-azo uracil, cytosine and thymine, 5-uracil (pseudo uracil), 4-thiouracil, 8-halo, oxa, amino, thiol, thioalkyl, hydroxyl and other 8-substituted adenines

- 19 -

and guanines, 5-trifluoromethyl and other 5-substituted uracils and cytosines, 7-methylguanine. Further purines and pyrimidines include those disclosed in United States Patent No. 3,687,808, those disclosed in the *Concise Encyclopedia* 5 *Of Polymer Science And Engineering*, pages 858-859, Kroschwitz, J.I., ed. John Wiley & Sons, 1990, and those disclosed by Englisch, et al., *Angewandte Chemie, International Edition* **1991**, 30, 613. All such oligomeric compounds are comprehended by this invention.

10       The nucleosidic monomers used in preparing oligomeric compounds of the present invention can include appropriate activated phosphorus groups such as activated phosphate groups and activated phosphite groups. As used herein, the terms activated phosphate and activated phosphite groups 15 refer to activated monomers or oligomers that are reactive with a hydroxyl group of another monomeric or oligomeric compound to form a phosphorus-containing internucleotide linkage. Such activated phosphorus groups contain activated phosphorus atoms in P<sup>III</sup> or P<sup>V</sup> valency states. Such activated 20 phosphorus atoms are known in the art and include, but are not limited to, phosphoramidite, H-phosphonate and phosphate triesters. A preferred synthetic solid phase synthesis utilizes phosphoramidites as activated phosphates. The phosphoramidites utilize P<sup>III</sup> chemistry. The intermediate 25 phosphite compounds are subsequently oxidized to the P<sup>V</sup> state using known methods to yield, in a preferred embodiment, phosphodiester or phosphorothioate internucleotide linkages. Additional activated phosphates and phosphites are disclosed in Tetrahedron Report Number 309 (Beaucage and Iyer, 30 *Tetrahedron*, **1992**, 48, 2223-2311).

A number of chemical functional groups can be introduced into compounds of the invention in a blocked form and subsequently deblocked to form a final, desired compound. Such groups can be introduced as groups directly 35 or indirectly attached at the heterocyclic base and the

- 20 -

sugar substituents at the 2', 3' and 5'-positions. In general, a blocking group renders a chemical functionality of a larger molecule inert to specific reaction conditions and can later be removed from such functionality without substantially damaging the remainder of the molecule (Green and Wuts, *Protective Groups in Organic Synthesis*, 2d edition, John Wiley & Sons, New York, 1991). For example, the nitrogen atom of amino groups can be blocked as phthalimido groups, as 9-fluorenylmethoxycarbonyl (Fmoc) groups, and with triphenylmethylsulfenyl, t-BOC or benzyl groups. Carboxyl groups can be protected as acetyl groups. Representative hydroxyl protecting groups are described by Beaucage et al., *Tetrahedron* **1992**, 48, 2223. Preferred hydroxyl protecting groups are acid-labile, such as the trityl, monomethoxytrityl, dimethoxytrityl, trimethoxytrityl, 9-phenylxanthine-9-yl (Pixyl) and 9-(p-methoxyphenyl)xanthine-9-yl (MOX). Chemical functional groups can also be "blocked" by including them in a precursor form. Thus, an azido group can be used considered as a "blocked" form of an amine since the azido group is easily converted to the amine. Further representative protecting groups utilized in oligonucleotide synthesis are discussed in Agrawal, et al., *Protocols for Oligonucleotide Conjugates*, Eds, Humana Press; New Jersey, 1994; Vol. 26 pp. 1-72.

Examples of hydroxyl protecting groups include, but are not limited to, t-butyl, t-butoxymethyl, methoxymethyl, tetrahydropyranyl, 1-ethoxyethyl, 1-(2-chloroethoxy)ethyl, 2-trimethylsilylethyl, p-chlorophenyl, 2,4-dinitrophenyl, benzyl, 2,6-dichlorobenzyl, diphenylmethyl, p,p'-dinitrobenzhydryl, p-nitrobenzyl, triphenylmethyl, trimethylsilyl, triethylsilyl, t-butyldimethylsilyl, t-butyldiphenylsilyl, triphenylsilyl, benzoylformate, acetate, chloroacetate, trichloroacetate, trifluoroacetate,

- 21 -

pivaloate, benzoate, p-phenylbenzoate, 9-fluorenylmethyl carbonate, mesylate and tosylate.

Amino-protecting groups stable to acid treatment are selectively removed with base treatment, and are used to  
5 make reactive amino groups selectively available for substitution. Examples of such groups are the Fmoc (E. Atherton and R.C. Sheppard in *The Peptides*, S. Udenfriend, J. Meienhofer, Eds., Academic Press, Orlando, 1987, volume 9, p.1), and various substituted sulfonylethyl carbamates  
10 exemplified by the Nsc group (Samukov et al., *Tetrahedron Lett*, 1994, 35:7821; Verhart and Tesser, *Rec. Trav. Chim. Pays-Bas*, 1987, 107:621).

Additional amino-protecting groups include but are not limited to, carbamate-protecting groups, such as 2-  
15 trimethylsilylethoxycarbonyl (Teoc), 1-methyl-1-(4-biphenyl)ethoxycarbonyl (Bpoc), t-butoxycarbonyl (BOC), allyloxycarbonyl (Alloc), 9-fluorenylmethyloxycarbonyl (Fmoc), and benzyloxycarbonyl (Cbz); amide-protecting groups, such as formyl, acetyl, trihaloacetyl, benzoyl, and  
20 nitrophenylacetyl; sulfonamide-protecting groups, such as 2-nitrobenzenesulfonyl; and imine- and cyclic imide-protecting groups, such as phthalimido and dithiasuccinoyl. Equivalents of these amino-protecting groups are also encompassed by the compounds and methods of the present  
25 invention.

In some especially preferred embodiments, one or more of the internucleoside linkages comprising oligomeric compounds of the invention are optionally protected phosphorothioate internucleoside linkages. Representative  
30 protecting groups for phosphorus containing internucleoside linkages such as phosphite, phosphodiester and phosphorothioate linkages include  $\beta$ -cyanoethyl, diphenylsilylethyl,  $\delta$ -cyanobutenyl, cyano p-xylyl (CPX), N-methyl-N-trifluoroacetyl ethyl (META), acetoxymethoxy ethyl (APE) and butene-  
35 4-yl groups. See for example U.S. Patents Nos. 4,725,677

- 22 -

and Re. 34,069 ( $\beta$ -cyanoethyl); Beaucage, S.L. and Iyer, R.P., *Tetrahedron*, **49** No. 10, pp. 1925-1963 (1993); Beaucage, S.L. and Iyer, R.P., *Tetrahedron*, **49** No. 46, pp. 10441-10488 (1993); Beaucage, S.L. and Iyer, R.P.,  
5 *Tetrahedron*, **48** No. 12, pp. 2223-2311 (1992).

In the context of this specification, alkyl (generally  $C_1$ - $C_{20}$ ), alkenyl (generally  $C_2$ - $C_{20}$ ), and alkynyl (generally  $C_2$ - $C_{20}$ ) (with more preferred ranges from  $C_1$ - $C_{10}$  alkyl,  $C_2$ - $C_{10}$  alkenyl and  $C_2$ - $C_{10}$  alkynyl), groups include but are not  
10 limited to substituted and unsubstituted straight chain, branch chain, and alicyclic hydrocarbons, including methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl, undecyl, dodecyl, tridecyl, tetradecyl, pentadecyl, hexadecyl, heptadecyl, octadecyl, nonadecyl, eicosyl and  
15 other higher carbon alkyl groups. Further examples include 2-methylpropyl, 2-methyl-4-ethylbutyl, 2,4-diethylbutyl, 3-propylbutyl, 2,8-dibutyldecyl, 6,6-dimethyloctyl, 6-propyl-6-butyloctyl, 2-methylbutyl, 2-methylpentyl, 3-methylpentyl, 2-ethylhexyl and other branched chain groups, allyl, crotyl,  
20 propargyl, 2-pentenyl and other unsaturated groups containing a pi bond, cyclohexane, cyclopentane, adamantane as well as other alicyclic groups, 3-penten-2-one, 3-methyl-2-butanol, 2-cyanoctyl, 3-methoxy-4-heptanal, 3-nitrobutyl, 4-isopropoxydodecyl, 4-azido-2-nitrodecyl, 5-mercaptononyl,  
25 4-amino-1-pentenyl as well as other substituted groups. Representative alkyl substituents are disclosed in United States Patent No. 5,212,295, at column 12, lines 41-50, hereby incorporated by reference in its entirety.

Further, in the context of this invention, a straight  
30 chain compound means an open chain compound, such as an aliphatic compound, including alkyl, alkenyl, or alkynyl compounds; lower alkyl, alkenyl, or alkynyl as used herein include but are not limited to hydrocarbyl compounds from about 1 to about 6 carbon atoms. A branched compound, as  
35 used herein, comprises a straight chain compound, such as an

- 23 -

alkyl, alkenyl, alkynyl compound, which has further straight or branched chains attached to the carbon atoms of the straight chain.

A cyclic compound, as used herein, refers to closed  
5 chain compounds, i.e. a ring of carbon atoms, such as an alicyclic or aromatic compound. The straight, branched, or cyclic compounds may be internally interrupted, as in alkoxy or heterocyclic compounds. In the context of this invention, internally interrupted means that the carbon  
10 chains may be interrupted with heteroatoms such as O, N, or S. However, if desired, the carbon chain may have no heteroatoms.

Compounds of the invention can include ring structures that include a nitrogen atom (e.g.,  $-N(R_1)(R_2)$  and  $-N(R_3)(R_4)$   
15 where  $(R_1)(R_2)$  and  $(R_3)(R_4)$  each form cyclic structures about the respective N to which they are attached). The resulting ring structure is a heterocycle or a heterocyclic ring structure that can include further heteroatoms selected from N, O and S. Such ring structures may be mono-, bi- or  
20 tricyclic, and may be substituted with substituents such as oxo, acyl, alkoxy, alkoxycarbonyl, alkyl, alkenyl, alkynyl, amino, amido, azido, aryl, heteroaryl, carboxylic acid, cyano, guanidino, halo, haloalkyl, haloalkoxy, hydrazino, ODMT, alkylsulfonyl, nitro, sulfide, sulfone, sulfonamide,  
25 thiol and thioalkoxy. A preferred bicyclic ring structure that includes nitrogen is phthalimido.

In general, the term "hetero" denotes an atom other than carbon, preferably but not exclusively N, O, or S. Accordingly, the term "heterocyclic ring" denotes an alkyl  
30 ring system having one or more heteroatoms (i.e., non-carbon atoms). Heterocyclic ring structures of the present invention can be fully saturated, partially saturated, unsaturated or with a polycyclic heterocyclic ring each of the rings may be in any of the available states of  
35 saturation. Heterocyclic ring structures of the present

- 24 -

invention also include heteroaryl which includes fused systems including systems where one or more of the fused rings contain no heteroatoms. Heterocycles, including nitrogen heterocycles, according to the present invention  
5 include, but are not limited to, imidazole, pyrrole, pyrazole, indole, 1H-indazole,  $\alpha$ -carboline, carbazole, phenothiazine, phenoxazine, tetrazole, triazole, pyrrolidine, piperidine, piperazine and morpholine groups. A more preferred group of nitrogen heterocycles includes  
10 imidazole, pyrrole, indole, and carbazole groups.

In the context of this specification, aryl groups are substituted and unsubstituted aromatic cyclic moieties including but not limited to phenyl, naphthyl, anthracyl, phenanthryl, pyrenyl, and xylyl groups. Alkaryl groups are  
15 those in which an aryl moiety links an alkyl moiety to a core structure, and aralkyl groups are those in which an alkyl moiety links an aryl moiety to a core structure.

Oligomeric compounds according to the present invention that are hybridizable to a target nucleic acid preferably  
20 comprise from about 5 to about 50 nucleosides. It is more preferred that such compounds comprise from about 8 to about 30 nucleosides, with 15 to 25 nucleosides being particularly preferred. As used herein, a target nucleic acid is any nucleic acid that can hybridize with a complementary nucleic  
25 acid-like compound. Further in the context of this invention, "hybridization" shall mean hydrogen bonding, which may be Watson-Crick, Hoogsteen or reversed Hoogsteen hydrogen bonding between complementary nucleobases.

"Complementary" as used herein, refers to the capacity for  
30 precise pairing between two nucleobases. For example, adenine and thymine are complementary nucleobases which pair through the formation of hydrogen bonds. "Complementary" and "specifically hybridizable," as used herein, refer to precise pairing or sequence complementarity between a first  
35 and a second nucleic acid-like oligomers containing

- 25 -

nucleoside subunits. For example, if a nucleobase at a certain position of the first nucleic acid is capable of hydrogen bonding with a nucleobase at the same position of the second nucleic acid, then the first nucleic acid and the second nucleic acid are considered to be complementary to each other at that position. The first and second nucleic acids are complementary to each other when a sufficient number of corresponding positions in each molecule are occupied by nucleobases which can hydrogen bond with each other. Thus, "specifically hybridizable" and "complementary" are terms which are used to indicate a sufficient degree of complementarity such that stable and specific binding occurs between a compound of the invention and a target RNA molecule.

It is understood that an oligomeric compound of the invention need not be 100% complementary to its target RNA sequence to be specifically hybridizable. An oligomeric compound is specifically hybridizable when binding of the oligomeric compound to the target RNA molecule interferes with the normal function of the target RNA to cause a loss of utility, and there is a sufficient degree of complementarity to avoid non-specific binding of the oligomeric compound to non-target sequences under conditions in which specific binding is desired, i.e. under physiological conditions in the case of *in vivo* assays or therapeutic treatment, or in the case of *in vitro* assays, under conditions in which the assays are performed.

The oligomeric compounds of the present invention can be used in diagnostics, therapeutics and as research reagents. They can be used in pharmaceutical compositions by including a suitable pharmaceutically acceptable diluent or carrier. They further can be used for treating organisms having a disease characterized by the undesired production of a protein. The organism should be contacted with an oligonucleotide having a sequence that is capable of

- 26 -

specifically hybridizing with a strand of nucleic acid coding for the undesirable protein. Treatments of this type can be practiced on a variety of organisms ranging from unicellular prokaryotic and eukaryotic organisms to

5 multicellular eukaryotic organisms. Any organism that utilizes RNA-DNA transcription or RNA-protein translation as a fundamental part of its hereditary, metabolic or cellular control is susceptible to therapeutic and/or prophylactic treatment in accordance with this invention. Seemingly

10 diverse organisms such as bacteria, yeast, protozoa, algae, all plants and all higher animal forms including warm-blooded animals, can be treated. Further each cell of multicellular eukaryotes can be treated since they include both DNA-RNA transcription and RNA-protein translation as

15 integral parts of their cellular activity. Many of the organelles (e.g., mitochondria and chloroplasts) of eukaryotic cells also include transcription and translation mechanisms. Thus, single cells, cellular populations or organelles can also be included within the definition of

20 organisms that can be treated with therapeutic or diagnostic oligomeric compounds. As used herein, therapeutics is meant to include the eradication of a disease state, by killing an organism or by control of erratic or harmful cellular growth or expression.

25 Oligomeric compounds according to the invention can be assembled in solution or through solid-phase reactions, for example, on a suitable DNA synthesizer utilizing nucleosides, phosphoramidites and derivatized controlled pore glass (CPG) according to the invention and/or standard

30 nucleosidic monomer precursors. In addition to nucleosides that include a novel modification of the inventions other nucleoside within an oligonucleotide may be further modified with other modifications at the 2' position. Precursor nucleoside and nucleosidic monomer precursors used to form

35 such additional modification may carry substituents either

- 27 -

at the 2' or 3' positions. Such precursors may be synthesized according to the present invention by reacting appropriately protected nucleosides bearing at least one free 2' or 3' hydroxyl group with an appropriate alkylating agent such as, but not limited to, alkoxyalkyl halides, alkoxyalkylsulfonates, hydroxyalkyl halides, hydroxyalkyl sulfonates, aminoalkyl halides, aminoalkyl sulfonates, phthalimidoalkyl halides, phthalimidoalkyl sulfonates, alkylaminoalkyl halides, alkylaminoalkyl sulfonates, dialkylaminoalkyl halides, dialkylaminoalkylsulfonates, dialkylaminooxyalkyl halides, dialkylaminooxyalkyl sulfonates and suitably protected versions of the same. Preferred halides used for alkylating reactions include chloride, bromide, fluoride and iodide. Preferred sulfonate leaving groups used for alkylating reactions include, but are not limited to, benzenesulfonate, methylsulfonate, tosylate, p-bromobenzenesulfonate, triflate, trifluoroethylsulfonate, and (2,4-dinitroanilino)-benzenesulfonate.

Suitably protected nucleosides can be assembled into oligomeric compounds according to known techniques. See, for example, Beaucage et al., *Tetrahedron*, **1992**, 48, 2223.

The ability of oligomeric compounds to bind to their complementary target strands is compared by determining the melting temperature ( $T_m$ ) of the hybridization complex of the oligonucleotide and its complementary strand. The melting temperature ( $T_m$ ), a characteristic physical property of double helices, denotes the temperature (in degrees centigrade) at which 50% helical (hybridized) versus coil (unhybridized) forms are present.  $T_m$  is measured by using the UV spectrum to determine the formation and breakdown (melting) of the hybridization complex. Base stacking, which occurs during hybridization, is accompanied by a reduction in UV absorption (hypochromicity). Consequently, a reduction in UV absorption indicates a higher  $T_m$ . The

- 28 -

higher the  $T_m$ , the greater the strength of the bonds between the strands. The structure-stability relationships of a large number of nucleic acid modifications have been reviewed (Freier and Altmann, *Nucl. Acids Research*, **1997**,  
5 25, 4429-443).

The relative binding ability of the oligomeric compounds of the present invention was determined using protocols as described in the literature (Freier and Altmann, *Nucl. Acids Research*, **1997**, 25, 4429-443).

10 Typically absorbance versus temperature curves were determined using samples containing 4uM oligonucleotide in 100 mM Na<sup>+</sup>, 10 mM phosphate, 0.1 mM EDTA, and 4uM complementary, length matched RNA.

The *in vivo* stability of oligomeric compounds is an  
15 important factor to consider in the development of oligonucleotide therapeutics. Resistance of oligomeric compounds to degradation by nucleases, phosphodiesterases and other enzymes is therefore determined. Typical *in vivo* assessment of stability of the oligomeric compounds of the  
20 present invention is performed by administering a single dose of 5 mg/kg of oligonucleotide in phosphate buffered saline to BALB/c mice. Blood collected at specific time intervals post-administration is analyzed by HPLC or capillary gel electrophoresis (CGE) to determine the amount  
25 of the oligomeric compound remaining intact in circulation and the nature the of the degradation products.

Additional objects, advantages, and novel features of this invention will become apparent to those skilled in the art upon examination of the following examples, which are  
30 not intended to be limiting. All oligonucleotide sequences are listed in a standard 5' to 3' order from left to right.

- 29 -

**EXAMPLE 1****2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyl uridine**

2[2-(Dimethylamino)ethoxy]ethanol (Aldrich, 6.66 g, 50 mmol) was slowly added to a solution of borane in tetra-  
5 hydrofuran (1 M, 10 mL, 10 mmol) with stirring in a 100 mL bomb. Hydrogen gas evolved as the solid dissolved O<sup>2-</sup>, 2'-anhydro-5-methyluridine (1.2 g, 5 mmol), and sodium bicarbonate (2.5 mg) were added and the bomb was sealed, placed in an oil bath and heated to 155°C for 26 hours. The  
10 bomb was cooled to room temperature and opened. The crude solution was concentrated and the residue partitioned between water (200 mL) and hexanes (200 mL). The excess alcohol was extracted into the hexane layer. The aqueous layer was extracted with ethyl acetate (3x200 mL) and the  
15 combined organic layers were washed once with water, dried over anhydrous sodium sulfate and concentrated. The residue was columned on silica gel using methanol/methylene chloride 1:20 (which has 2% triethylamine) as the eluent. As the column fractions were concentrated a colorless solid formed  
20 which was collected to give 490 mg of the title compound as a white solid. R<sub>f</sub>=0.56 in CH<sub>2</sub>-CH<sub>12</sub>:CH<sub>3</sub>-OH (10:1); MS/ES calculated 374; observed 374.5.

**EXAMPLE 2****5'-O-dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)-  
25 ethyl]-5-methyl uridine**

To 0.5 g (1.3 mmol) of 2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyl uridine in anhydrous pyridine (8 mL), triethylamine (0.36 mL) and dimethoxytrityl chloride (DMT-Cl, 0.87 g, 2 eq.) were added and stirred for 1 hour.  
30 The reaction mixture was poured into water (200 mL) and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x200 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> layers were washed with saturated NaHCO<sub>3</sub> solution, followed by saturated NaCl solution and dried over anhydrous sodium

- 30 -

sulfate. Evaporation of the solvent followed by silica gel chromatography using MeOH:CH<sub>2</sub>Cl<sub>2</sub>:Et<sub>3</sub>N (20:1, v/v, with 1% triethylamine) gave 0.72 g (82%) of the title compound.

**EXAMPLE 3**

5 **5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)-ethyl]-5-methyl uridine-3'-O-(cyanoethyl-N,N-diisopropyl) phosphoramidate**

Diisopropylaminotetrazolide (0.6 g) and 2-cyanoethoxy-N,N-diisopropyl phosphoramidite (1.1 mL, 2 eq.) were added  
10 to a solution of 5'-O-dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyluridine (2.17 g, 3 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) under an atmosphere of argon. The reaction mixture was stirred overnight and the solvent evaporated. The resulting residue was purified by silica  
15 gel flash column chromatography with ethyl acetate as the eluent to give 1.98 g (83% yield) of the title compound.

**EXAMPLE 4**

**5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)-ethyl]-5-methyl-uridine-3'-O-succinate**  
20

5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyluridine (270 mg, 0.41 mmol) was heated with 68 mg of succinic anhydride (0.6 mmol), 4-N,N-dimethylamino pyridine (24 mg) and Et<sub>3</sub>N (56 µL) in  
25 dichloroethane (1 mL) at 50°C for 10 minutes in a Pyrex tube in a heating block. After cooling, the reaction mixture was diluted with methylene chloride (20 mL) and washed with a 10% aqueous solution of citric acid (3x20 mL) followed by water. The resulting solution was dried over anhydrous  
30 Na<sub>2</sub>SO<sub>4</sub> to give 217 mg (58% yield) of the title compound.

TLC indicated (CH<sub>2</sub>Cl<sub>2</sub>/MeOH, 10:1) a polar product at the origin, as expected.

- 31 -

**EXAMPLE 5**

**5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)-ethyl]-5-methyl-uridine-3'-O-succinyl controlled pore glass (CPG)**

5        5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-dimethylaminoethoxy)ethyl]-5-methyl-uridine-3'-O-succinate (116 mg, 0.15 mmol, 2 eq.) was dried under high vacuum overnight. To this dried material was added CPG (650 mg, 1 eq.), anhydrous DMF (2 mL), N-methylmorpholine (33  $\mu$ L, 4 eq.) and 2-1H-benzotriazole-1-yl 2-1H-benzotriazole-1-yl-1,1,3,3-tetramethyluronium-tetrafluoro-borate (TBTU, 48 mg, 2 eq.)  
10 was added to the reaction mixture with shaking for 12 hours. The CPG was then filtered and washed with DMF,  $\text{CH}_2\text{Cl}_2$ ,  $\text{CH}_3\text{CN}$  and  $\text{Et}_2\text{O}$ . Finally, it was dried and capped with acetic  
15 anhydride/ $\text{Et}_3\text{N}$ . The loading of the CPG was determined via the dimethoxytrityl assay method to be 53  $\mu$ moles/g.

**EXAMPLE 6**

**2-[2-((dimethylamino)ethyl)mercapto]ethanol**

2-(Dimethylamino)ethanethiol hydrochloride (Aldrich) is  
20 treated with NaOH (0.2N) in ethanol (95%). To this slurry, 2-bromoethanol (1.2 eq.) is added and the mixture is refluxed for 2 hours. The reaction mixture is cooled, filtered and concentrated. The resultant residue is purified by silica gel flash column chromatography to give  
25 the title compound.

**EXAMPLE 7**

**2'-O-[2-[2-((dimethylamino)ethyl)mercapto]ethyl]-5-methyl uridine**

2-[2-((dimethylamino)ethyl)mercapto] ethanol (50 mmol)  
30 is slowly added to a solution of borane in tetrahydrofuran (1 M, 10 mL, 10 mmol) with stirring in a 100 mL bomb. Hydrogen gas is evolved as the solid dissolves.  $\text{O}^2, 2'$ -

- 32 -

anhydro-5-methyluridine (1.2 g, 5 mmol), and sodium bicarbonate (2.5 mg) are added and the bomb is sealed, then placed in an oil bath and heated to 155°C for 26 hours. The bomb is cooled to room temperature and opened. The crude solution is concentrated and the residue partitioned between water (200 mL) and hexanes (200 mL). The excess phenol is extracted into hexanes. The aqueous layer is extracted with ethyl acetate (3x200 mL) and the combined organic layer is washed once with water and dried over anhydrous sodium sulfate and concentrated. The resultant residue is purified by silica gel flash column chromatography using methanol/methylene chloride having 2% triethylamine to give the title compound.

#### 15 **EXAMPLE 8**

##### **5'-O-Dimethoxytrityl-2'-O-2-[2-((dimethylamino)ethyl)-mercapto]ethyl]5-methyl uridine**

To 2'-O-2-[2-((dimethylamino)ethyl)mercapto]ethyl]5-methyl uridine (1.3 mmol) in anhydrous pyridine (8 mL), triethylamine (0.36 mL) and DMT-Cl (0.87 g, 2 eq.) are added and stirred for 1 hour. The reaction mixture is poured into water (200 mL) and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x200 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> layers are washed with saturated NaHCO<sub>3</sub> solution, saturated NaCl solution, dried over anhydrous sodium sulfate and concentrated. The resultant residue is purified by silica gel flash column chromatography using methanol/methylene chloride having 1% triethylamine to give the title compound.

- 33 -

**EXAMPLE 9**

**5'-O-Dimethoxytrityl-2'-O-2-[2-((dimethylamino)ethyl)-mercapto]ethyl]5-methyl uridine-3'-O-(cyanoethyl-N,N-diisopropyl) phosphoramidate**

5        5'-O-Dimethoxytrityl-2'-O-2-[2-((dimethylamino)ethyl)-mercapto]ethyl]5-methyluridine (3 mmol) is dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) and to this solution, under argon, diisopropylaminotetrazolide (0.6 g) and 2-cyanoethoxy-N,N-diisopropyl phosphoramidite (1.1 mL, 2 eq.) are added. The  
10 reaction is stirred overnight and the solvent is evaporated. The resultant residue is purified by silica gel flash column chromatography using ethyl acetate to give the title phosphoramidite.

**EXAMPLE 10**

15        **5'-O-Dimethoxytrityl-2'-O-2-[2-((dimethylamino)ethyl)-mercapto]ethyl]5-methyl-uridine-3'-O-succinate**

          5'-O-Dimethoxytrityl-2'-O-2-[2-((dimethylamino)ethyl)-mercapto]ethyl]5-methyluridine (0.41 mmol) is heated with succinic anhydride (68 mg, 0.6 mmol), 4-N,N-dimethylamino  
20 pyridine (24 mg) and Et<sub>3</sub>N (56  $\mu$ L) in dichloroethane (1 mL) at 50°C for 10 minutes in a Pyrex tube in a heating block. After cooling the reaction mixture is diluted with methylene chloride (20 mL) and washed with 10% citric acid aqueous solution (3x20 mL) followed by water and dried over  
25 anhydrous Na<sub>2</sub>SO<sub>4</sub> to give the title succinate.

**EXAMPLE 11**

**5'-O-Dimethoxytrityl-2'-O-2-[2-((dimethylamino)ethyl)-mercapto]ethyl]5-methyl-uridine-3'-O-succinyl controlled pore glass (CPG)**

30        The succinate from Example 10 above (0.15 mmol, 2 eq.) is dried under vacuum overnight. CPG (650 mg, 1 eq.), anhydrous DMF (2 mL), 33  $\mu$ L of N-methylmorpholine (4 eq.)

- 34 -

and 48 mg (2 eq.) of TBTU (2-1H-benzotriazole-1-yl) are added to the dried succinate. 1,1,3,3-tetramethyluronium-tetrafluoroborate is added and the mixture is shaken for 12 hours. The CPG is then filtered and washed with DMF, CH<sub>2</sub>Cl<sub>2</sub>,  
5 CH<sub>3</sub>CN and Et<sub>2</sub>O. The CPG is dried and capped with acetic anhydride/Et<sub>3</sub>N. The loading is determined using the standard dimethoxytrityl assay.

**EXAMPLE 12****2-[2-(diethylamino)ethoxy] ethanol**

10 2-(2-aminoethoxy)ethanol (Aldrich 0.5 mmol) is treated with NaBH<sub>3</sub>CN (Aldrich, 200 mg, 3.0 mmol) in 50% aqueous methanol (30 mL). To this solution, acetaldehyde 95% purity (2 mL, 17 mmol) is added in one portion and the mixture is heated at 50°C for 2 days in a flask under argon. After  
15 removal of the solvent under reduced pressure, the residue is dissolved in water, extracted with ethylacetate to give the title compound.

**EXAMPLE 13****2'-O-[2(2-N,N-diethylaminoethoxy)ethyl]-5-methyl uridine**

20 2[2-(Diethylamino)ethoxy]ethanol (50 mmol) is slowly added to a solution of borane in tetrahydrofuran (1 M, 10 mL, 10 mmol) with stirring in a 100 mL bomb. Hydrogen gas evolves as the solid dissolves O<sup>2</sup>-2'-anhydro-5-methyluridine (1.2 g, 5 mmol), and sodium bicarbonate (2.5 mg) are added  
25 and the bomb is sealed, placed in an oil bath and heated to 155°C for 26 hours. The bomb is cooled to room temperature and opened. The crude solution is concentrated and the residue partitioned between water (200 mL) and hexanes (200 mL). The excess alcohol is extracted into the hexane layer.  
30 The aqueous layer is extracted with ethyl acetate (3x200 mL) and the combined organic layers are washed once with water, dried over anhydrous sodium sulfate and concentrated. The

- 35 -

residue is columned on silica gel using methanol/methylene chloride 1:20 (which has 2% triethylamine) as the eluent. The appropriate column fractions are concentrated and concentrated to give the title compound.

**5 EXAMPLE 14****5'-O-dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)-ethyl]-5-methyl uridine**

To 1.3 mmol of 2'-O-[2(2-N,N-diethylaminoethoxy)-ethyl]-5-methyl uridine in anhydrous pyridine (8 mL),  
10 triethylamine (0.36 mL) and dimethoxytrityl chloride (DMT-Cl, 0.87 g, 2 eq.) are added and stirred for 1 hour. The reaction mixture is poured into water (200 mL) and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x200 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> layers are washed with saturated NaHCO<sub>3</sub> solution, followed by saturated NaCl  
15 solution and dried over anhydrous sodium sulfate. Evaporation of the solvent followed by silica gel chromatography using MeOH:CH<sub>2</sub>Cl<sub>2</sub>:Et<sub>3</sub>N (20:1, v/v, with 1% triethylamine) gives the title compound.

**EXAMPLE 15****20 5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)-ethyl]-5-methyluridine-3'-O-(cyanoethyl-N,N-diisopropyl) phosphoramidate**

Diisopropylaminotetrazolide (0.6 g) and 2-cyanoethoxy-N,N-diisopropyl phosphoramidite (1.1 mL, 2 eq.) are added to  
25 a solution of 5'-O-dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)ethyl]-5-methyluridine (3 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) under an atmosphere of argon. The reaction mixture is stirred overnight and the solvent evaporated. The resulting residue is purified by silica gel  
30 flash column chromatography with ethyl acetate as the eluent to give title compound.

- 36 -

**EXAMPLE 16**

**5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)-ethyl]-5-methyl-uridine-3'-O-succinate**

5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)ethyl]-5-methyluridine (0.41 mmol) is heated with 68 mg of succinic anhydride (0.6 mmol), 4-N,N-diethylamino pyridine (24 mg) and Et<sub>3</sub>N (56 µL) in dichloroethane (1 mL) at 50°C for 10 minutes in a Pyrex tube in a heating block. After cooling, the reaction mixture is diluted with methylene chloride (20 mL) and washed with a 10% aqueous solution of citric acid (3x20 mL) followed by water. The resulting solution is dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> to give the title compound.

**EXAMPLE 17**

**5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)-ethyl]-5-methyl-uridine-3'-O-succinyl controlled pore glass (CPG)**

5'-O-Dimethoxytrityl-2'-O-[2(2-N,N-diethylaminoethoxy)ethyl]-5-methyl-uridine-3'-O-succinate (0.15 mmol, 2 eq.) is dried under high vacuum overnight. To this dried material is added CPG (650 mg, 1 eq.), anhydrous DMF (2 mL), N-methylmorpholine (33 µL, 4 eq.) and 2-1H-benzotriazole-1-yl-1,1,3,3-tetramethyluroniumtetrafluoroborate (TBTU, 48 mg, 2 eq.) is added to the reaction mixture with shaking for 12 hours. The CPG is then filtered and washed with DMF, CH<sub>2</sub>Cl<sub>2</sub>, CH<sub>3</sub>CN and Et<sub>2</sub>O. Finally, it is dried and capped with acetic anhydride/Et<sub>3</sub>N. The loading of the CPG is determined via the dimethoxytrityl assay method.

**EXAMPLE 18**

**2-[bis-2-(N,N-dimethylamino-ethyl)amino ethoxy] ethanol**

N,N-Dimethylaminoacetaldehyde diethyl acetal (Aldrich, 1 mmol) is treated with aqueous solution of trifluoroacetic

- 37 -

acid and refluxed overnight to give N,N-dimethylamino acetaldehyde. 2-(2-Aminoethoxy)ethanol is treated with NaBH<sub>3</sub>CN and N,N-dimethylamino acetaldehyde in methanol solvent and refluxed over night. After removal of the  
5 solvent under reduced pressure, the residue is dissolved in water, extracted with ethyl acetate and purified by column chromatography to give the title compound.

**EXAMPLE 19**

**2'-O-[2(bis-2-N,N-dimethylaminoethyl)ethoxy)ethyl]-5-methyl  
10 uridine**

2[2-(Bis-N,N-dimethylaminomethyl)ethoxy]ethanol (50 mmol) is slowly added to a solution of borane in tetrahydrofuran (1 M, 10 mL, 10 mmol) with stirring in a 100 mL bomb. Hydrogen gas evolves as the solid dissolves O<sup>2</sup>-2'-  
15 anhydro-5-methyluridine (1.2 g, 5 mmol), and sodium bicarbonate (2.5 mg) are added and the bomb is sealed, placed in an oil bath and heated to 155°C for 26 hours. The bomb is cooled to room temperature and opened. The crude solution is concentrated and the residue partitioned between  
20 water (200 mL) and hexanes (200 mL). The excess alcohol is extracted into the hexane layer. The aqueous layer is extracted with ethyl acetate (3x200 mL) and the combined organic layers are washed once with water, dried over anhydrous sodium sulfate and concentrated. The residue is  
25 columned on silica gel using methanol/methylene chloride 1:20 (which has 2% triethylamine) as the eluent. The column fractions are concentrated to give the title compound.

**EXAMPLE 20**

**5'-O-Dimethoxytrityl-2'-O-[2(2-(bis-N,N-dimethylaminoethyl)-  
30 ethoxy)ethyl)]-5-methyl uridine**

To 1.3 mmol of 2'-O-[2(2-(bis-N,N-dimethylaminoethyl)-ethoxy)ethyl)]-5-methyl uridine in anhydrous pyridine (8

- 38 -

mL), triethylamine (0.36 mL) and dimethoxytrityl chloride (DMT-Cl, 0.87 g, 2 eq.) are added with stirring for 1 hour. The reaction mixture is poured into water (200 mL) and extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x200 mL). The combined CH<sub>2</sub>Cl<sub>2</sub> layers  
5 are washed with saturated NaHCO<sub>3</sub> solution, followed by saturated NaCl solution and dried over anhydrous sodium sulfate. Evaporation of the solvent followed by silica gel chromatography using MeOH:CH<sub>2</sub>Cl<sub>2</sub>:Et<sub>3</sub>N (20:1, v/v, with 1% triethylamine) gives the title compound.

**10 EXAMPLE 21**

**5'-O-Dimethoxytrityl-2'-O-[2(2-(bis-N,N-dimethylaminoethyl)-ethoxy)ethyl]-5-methyl uridine-3'-O-(cyanoethyl-N,N-diisopropyl) phosphoramidate**

Diisopropylaminotetrazolide (0.6 g) and 2-cyanoethoxy-  
15 N,N-diisopropyl phosphoramidite (1.1 mL, 2 eq.) are added to a solution of 5'-O-dimethoxytrityl-2'-O-[2(2-(bis-N,N-dimethylaminoethyl)ethoxy)ethyl]-5-methyluridine (3 mmol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) under an atmosphere of argon. The reaction mixture is stirred overnight and the solvent  
20 evaporated. The resulting residue is purified by silica gel flash column chromatography with ethyl acetate as the eluent to give title compound.

**EXAMPLE 22**

**25 5'-O-Dimethoxytrityl-2'-O-[2(2-bis(N,N-dimethylaminoethyl)-ethoxy)ethyl]-5-methyl-uridine-3'-O-succinate**

5'-O-Dimethoxytrityl-2'-O-[2(2-bis-N,N-dimethylaminoethylethoxy)ethyl]-5-methyluridine (0.41 mmol) is heated with 68 mg of succinic anhydride (0.6 mmol), 4-N,N-  
30 dimethylaminoethyl pyridine (24 mg) and Et<sub>3</sub>N (56 µL) in dichloroethane (1 mL) at 50°C for 10 minutes in a Pyrex tube in a heating block. After cooling, the reaction mixture is diluted with methylene chloride (20 mL) and washed with a

- 39 -

10% aqueous solution of citric acid (3x20 mL) followed by water. The resulting solution is dried over anhydrous  $\text{Na}_2\text{SO}_4$  to give the title compound.

**EXAMPLE 23**

5 **5'-O-Dimethoxytrityl-2'-O-[2(2-bis(N,N-dimethylaminoethyl-ethoxy)ethyl)]-5-methyl-uridine-3'-O-succinyl controlled pore glass (CPG)**

5'-O-Dimethoxytrityl-2'-O-[2(2-bis-N,N-dimethylamino-ethylethoxy)ethyl)]-5-methyl-uridine-3'-O-succinate (0.15  
10 mmol, 2 eq.) is dried under high vacuum overnight. To this dried material is added CPG (650 mg, 1 eq.), anhydrous DMF (2 mL), N-methylmorpholine (33  $\mu\text{L}$ , 4 eq.) and 2-1H-benzotriazole-1-yl-1,1,3,3-tetramethyluroniumtetrafluoroborate (TBTU, 48 mg, 2 eq.) is added to the reaction mixture  
15 with shaking for 12 hours. The CPG is then filtered and washed with DMF,  $\text{CH}_2\text{Cl}_2$ ,  $\text{CH}_3\text{CN}$  and  $\text{Et}_2\text{O}$ . Finally, it is dried and capped with acetic anhydride/ $\text{Et}_3\text{N}$ . The loading of the CPG is determined via the dimethoxytrityl assay method.

**EXAMPLE 24**

20 **General procedures for oligonucleotide synthesis**

Oligomeric compounds are synthesized on a PerSeptive Biosystems Expedite 8901 Nucleic Acid Synthesis System. Multiple 1-mmol syntheses are performed for each oligonucleotide. The 3'-end nucleoside containing solid  
25 support is loaded into the column. Trityl groups are removed with trichloroacetic acid (975 mL over one minute) followed by an acetonitrile wash. The oligonucleotide is built using a modified diester or thioate protocol.

**Phosphodiester protocol**

30 All standard amidites (0.1 M) are coupled over a 1.5 minute time frame, delivering 105  $\mu\text{L}$  material. All novel amidites are dissolved in dry acetonitrile (100 mg of

- 40 -

amidite/1 mL acetonitrile) to give approximately 0.08-0.1 M solutions. The 2'-modified amidite is double coupled using 210  $\mu$ L over a total of 5 minutes. Total coupling time is approximately 5 minutes (210 mL of amidite delivered).

5 1-H-tetrazole in acetonitrile is used as the activating agent. Excess amidite is washed away with acetonitrile.

(1S)-(+)-(10-camphorsulfonyl) oxaziridine (CSO, 1.0 g CSO/8.72 mL dry acetonitrile) is used to oxidize (3 minute wait step) delivering approximately 375  $\mu$ L of oxidizer.

10 Standard amidites are delivered (210  $\mu$ L) over a 3-minute period.

#### Phosphorothioate protocol

The 2'-modified amidite is double coupled using 210  $\mu$ L over a total of 5 minutes. The amount of oxidizer,

15 3H-1,2-benzodithiole-3-one-1,1-dioxide (Beaucage reagent, 3.4 g Beaucage reagent/200 mL acetonitrile), is 225  $\mu$ L (one minute wait step). The unreacted nucleoside is capped with a 50:50 mixture of tetrahydrofuran/acetic anhydride and tetrahydrofuran/pyridine/1-methyl imidazole. Trityl yields  
20 are followed by the trityl monitor during the duration of the synthesis. The final DMT group is left intact. After the synthesis, the contents of the synthesis cartridge (1 mmole) is transferred to a Pyrex vial and the oligonucleotide is cleaved from the controlled pore glass  
25 (CPG) using 30% ammonium hydroxide ( $\text{NH}_4\text{OH}$ , 5 mL) for approximately 16 hours at 55°C.

#### Oligonucleotide Purification

After the deprotection step, the samples are filtered from CPG using Gelman 0.45  $\mu$ m nylon acrodisc syringe

30 filters. Excess  $\text{NH}_4\text{OH}$  is evaporated away in a Savant AS160 automatic speed vac. The crude yield is measured on a Hewlett Packard 8452A Diode Array Spectrophotometer at 260 nm. Crude samples are then analyzed by mass spectrometry (MS) on a Hewlett Packard electrospray mass spectrometer.

35 Trityl-on oligomeric compounds are purified by reverse phase

- 41 -

preparative high performance liquid chromatography (HPLC). HPLC conditions are as follows: Waters 600E with 991 detector; Waters Delta Pak C4 column (7.8X300mm); Solvent A: 50 mM triethylammonium acetate (TEA-Ac), pH 7.0; Solvent B: 100% acetonitrile; 2.5 mL/min flow rate; Gradient: 5% B for first five minutes with linear increase in B to 60% during the next 55 minutes. Fractions containing the desired product/s (retention time = 41 minutes for DMT-ON-16314; retention time = 42.5 minutes for DMT-ON-16315) are collected and the solvent is dried off in the speed vac. Oligomeric compounds are detritylated in 80% acetic acid for approximately 60 minutes and lyophilized again. Free trityl and excess salt are removed by passing detritylated oligomeric compounds through Sephadex G-25 (size exclusion chromatography) and collecting appropriate samples through a Pharmacia fraction collector. The solvent is again evaporated away in a speed vac. Purified oligomeric compounds are then analyzed for purity by CGE, HPLC (flow rate: 1.5 mL/min; Waters Delta Pak C4 column, 3.9X300mm), and MS. The final yield is determined by spectrophotometer at 260 nm.+

## PROCEDURES

### PROCEDURE 1

#### ICAM-1 Expression

**Oligonucleotide Treatment of HUVECs:** Cells were washed three times with Opti-MEM (Life Technologies, Inc.) prewarmed to 37°C. Oligomeric compounds were premixed with 10µg/mL Lipofectin (Life Technologies, Inc.) in Opti-MEM, serially diluted to the desired concentrations, and applied to washed cells. Basal and untreated (no oligonucleotide) control cells were also treated with Lipofectin. Cells were incubated for 4 h at 37°C, at which time the medium was removed and replaced with standard growth medium with or

- 42 -

without 5 mg/mL TNF- $\alpha$  ® & D Systems). Incubation at 37°C was continued until the indicated times.

**Quantitation of ICAM-1 Protein Expression by**

**Fluorescence-activated Cell Sorter:** Cells were removed from  
5 plate surfaces by brief trypsinization with 0.25% trypsin in  
PBS. Trypsin activity was quenched with a solution of 2%  
bovine serum albumin and 0.2% sodium azide in PBS (+Mg/Ca).  
Cells were pelleted by centrifugation (1000 rpm, Beckman GPR  
centrifuge), resuspended in PBS, and stained with 3  $\mu$ l/10<sup>5</sup>  
10 cells of the ICAM-1 specific antibody, CD54-PE (Pharmingen).  
Antibodies were incubated with the cells for 30 min at 4°C  
in the dark, under gently agitation. Cells were washed by  
centrifugation procedures and then resuspended in 0.3 mL of  
FacsFlow buffer (Becton Dickinson) with 0.5% formaldehyde  
15 (Polysciences). Expression of cell surface ICAM-1 was then  
determined by flow cytometry using a Becton Dickinson  
FACScan. Percentage of the control ICAM-1 expression was  
calculated as follows: [(oligonucleotide-treated ICAM-1  
value) - (basal ICAM-1 value)/(non-treated ICAM-1 value) -  
20 (basal ICAM-1 value)]. (Baker, Brenda, et. al. 2'-O-(2-  
Methoxy)ethyl-modified Anti-intercellular Adhesion Molecule  
1 (ICAM-1) Oligomeric compounds Selectively Increase the  
ICAM-1 mRNA Level and Inhibit Formation of the ICAM-1  
Translation Initiation Complex in Human Umbilical Vein  
25 Endothelial Cells, *The Journal of Biological Chemistry*, 272,  
11994-12000, **1997**.)

ICAM-1 expression of 2'-O-[2-(2-N,N-  
dimethylaminoethyl)oxyethyl]-5-methyl modified oligomeric  
compounds of the invention is measured by the reduction of  
30 ICAM-1 levels in treated HUVEC cells. The oligomeric  
compounds are believed to work by a direct binding RNase H  
independent mechanism. Appropriate scrambled control  
oligomeric compounds are used as controls. They have the  
same base composition as the test sequence.

- 43 -

Sequences that contain the 2'-O-[2-(2-N,N-dimethyl-aminoethyl)oxyethyl]-5-methyl modification as listed in Table 1 below are prepared and tested in the above assay. SEQ ID NO: 3, a C-raf targeted oligonucleotide, is used as a control.

**Table 1**  
**Oligomeric compounds Containing 2'-O-[2-(2-N,N-dimethyl aminoethyl)oxyethyl]-5-methyl modification**

All nucleosides in bold are 2'-O-[2-(2-N,N-dimethylaminoethyl)oxyethyl]-5-methyl; subscript S indicates a phosphorothioate linkage; subscript O indicates a phosphodiester linkage; and a superscript m on a C (C<sup>m</sup>) indicates a 5-methyl-C.

## PROCEDURE 2

### Enzymatic Degradation of 2'-O-modified oligomeric compounds

Three oligomeric compounds are synthesized incorporating the modifications to the 3' nucleoside at the 2'-O- position (Table 2). These modified oligomeric compounds are subjected to snake venom phosphodiesterase to determine their nuclease resistance. Oligomeric compounds (30 nanomoles) are dissolved in 20 mL of buffer containing 50 mM Tris-HCl pH 8.5, 14 mM MgCl<sub>2</sub>, and 72 mM NaCl. To this solution 0.1 units of snake-venom phosphodiesterase (Pharmacia, Piscataway, NJ), 23 units of nuclease P1 (Gibco LBRL, Gaithersburg, MD), and 24 units of calf intestinal

- 44 -

phosphatase (Boehringer Mannheim, Indianapolis, IN) are added and the reaction mixture is incubated at 37°C for 100 hours. HPLC analysis is carried out using a Waters model 715 automatic injector, model 600E pump, model 991 detector, and an Alltech (Alltech Associates, Inc., Deerfield, IL) nucleoside/nucleotide column (4.6 x 250 mm). All analyses are performed at room temperature. The solvents used are A: water and B: acetonitrile. Analysis of the nucleoside composition is accomplished with the following gradient: 0-5 min., 2% B (isocratic); 5-20 min., 2% B to 10% B (linear); 20-40 min., 10% B to 50% B. The integrated area per nanomole is determined using nucleoside standards. Relative nucleoside ratios are calculated by converting integrated areas to molar values and comparing all values to thymidine, which is set at its expected value for each oligomer.

**Table 2**

### PROCEDURE 3

**General procedure for the evaluation of gapped 2'-O-DMAEOE modified oligomeric compounds targeted to Ha-ras**

Different types of human tumors, including sarcomas, neuroblastomas, leukemias and lymphomas, contain active oncogenes of the *ras* gene family. *Ha-ras* is a family of small molecular weight GTPases whose function is to regulate cellular proliferation and differentiation by transmitting signals resulting in constitutive activation of *ras* are associated with a high percentage of diverse human cancers.

- 45 -

Thus, *ras* represents an attractive target for anticancer therapeutic strategies.

SEQ ID NO: 6 is a 20-base phosphorothioate oligodeoxynucleotide targeting the initiation of translation region of human *Ha-ras* and it is a potent isotype-specific inhibitor of *Ha-ras* in cell culture based on screening assays ( $IC_{50}=45$  nm). Treatment of cells *in vitro* with SEQ ID NO: 6 results in a rapid reduction of *Ha-ras* mRNA and protein synthesis and inhibition of proliferation of cells containing an activating *Ha-ras* mutation. When administered at doses of 25 mg/kg or lower by daily intraperitoneal injection (IP), SEQ ID NO: 6 exhibits potent antitumor activity in a variety of tumor xenograft models, whereas mismatch controls do not display antitumor activity. SEQ ID NO: 6 has been shown to be active against a variety of tumor types, including lung, breast, bladder, and pancreas in mouse xenograft studies (Cowser, L.M. *Anti-cancer drug design*, 1997, 12, 359-371). A second-generation analog of SEQ ID NO: 6, where the 5' and 3' termini ("wings") of the sequence are modified with 2'-methoxyethyl (MOE) modification and the backbone is kept as phosphorothioate (Table 2, SEQ ID NO: 12), exhibits  $IC_{50}$  of 15 nm in cell culture assays. thus, a 3-fold improvement in efficacy is observed from this chimeric analog. Because of the improved nuclease resistance of the 2'-MOE phosphorothioate, SEQ ID NO: 12 increases the duration of antisense effect *in vitro*. This will relate to frequency of administration of this drug to cancer patients. SEQ ID NO: 12 is currently under evaluation in *ras* dependent tumor models (Cowser, L.M. *Anti-cancer drug design*, 1997, 12, 359-371). The parent compound, SEQ ID NO: 6, is in Phase I clinical trials against solid tumors by systemic infusion. Antisense oligomeric compounds having the 2'-O-DMAEOE modification are prepared and tested in the aforementioned assays in the manner described to determine activity.

- 46 -

Oligomeric compounds that are initially prepared are listed in Table 3 below.

**Table 3**  
**Ha-ras Antisense Oligomeric compounds With 2'-O-DMAEOE**

underlined portions of sequences are 2'-deoxy

#### PROCEDURE 4

##### General procedure for the evaluation of 2'-O-DMAEOE

##### oligomeric compounds targeted to HCV

Uniformly modified 2'-O-DMAEOE phosphodiester oligomeric compounds are evaluated for antisense inhibition of HCV gene via a translation arrest mechanism.

- 47 -

Hepatitis C virus (HCV) is known to be responsible for liver disease in many millions of people throughout the world. HCV is an enveloped, positive-strand RNA virus of the flavivirus family. Initial infections in humans are typically asymptomatic, but chronic infection often ensues in which liver cirrhosis and hepatocellular carcinoma are long-term sequelae. Interferon- $\alpha$  (IFN- $\alpha$ ) therapy is widely used in attempts to eradicate the virus from chronically infected individuals, but long-term remissions are achieved in only about 20% of patients, even after 6 months of therapy. So far, there is no antiviral drug available for the treatment of HCV. (Blair et al., 1998). Drug discovery and development efforts have been hampered by the lack of suitable cell culture replication assays for HCV, and vaccine production has been hampered by genetic variability of the virus' envelope genes. Specific inhibitors of cloned viral enzymes such as proteases and the viral polymerase have not yet been reported.

Antisense oligonucleotide therapy represents a novel approach to the control of HCV infection. Several antisense oligomeric compounds complementary to HCV RNA sequences adjacent to the polyprotein initiation codon of HCV have been designed at Isis (Hanecak et al., *J. Virol.*, **1996**, 70, 5203-5212). The target genome is highly conserved among independent HCV isolates.

It was shown that an RNase H-independent antisense oligonucleotide had greater activity than its parent phosphorothioate (which will work by RNase H mechanism) which was targeted to the AUG site of a core protein sequence of HCV in a human hepatocyte cell line employing a uniformly modified 2'-O-(methoxyethyl) phosphodiester (P=O 20 mer) (Hanecak et al., *J. Virol.*, **1996**, 70, 5203-5212). Hepatitis C virus core protein levels were reduced as efficiently as the corresponding 2'-deoxyphosphorothioate with an IC<sub>50</sub> of 100 nm. SEQ ID NO: 15 was a potent inhibitor

- 48 -

of core protein expression without affecting HCV RNA levels. This suggested the inhibition of HCV translation. The parent compound (SEQ ID NO: 14) had T<sub>m</sub> of 50.8°C while the 2'-MOE compound (SEQ ID NO: 15) had a T<sub>m</sub> of 83.8°C. Thus, SEQ ID NO: 15 had a better affinity for HCV RNA. The replicative cycle of HCV takes place in the cytoplasm of infected cells, in which RNase H levels have been reported to reduce relative to those of the nucleus. For this reason, it is better to utilize an antisense oligonucleotide which will work by non-RNase H mechanism to inhibit HCV. Oligonucleotide SEQ ID NO: 15 is an attractive lead since it contains a P=O linkage with a 2'-MOE modification. SEQ ID NO: 16 will be tested in accordance with the testing of SEQ ID NO: 14 and 15.

15	P=O	2'-MOE	83.8
16	P=O	2'-2'-O-DMAEOE	

## PROCEDURE 5

### *In vitro* Assays

Isis antisense oligomeric compounds complementary to the HCV polyprotein initiation codon sequence are known to inhibit expression of the viral core protein in immortalized cell lines engineered to express HCV RNA from recombinant DNA integrated into the host cell genome (Hanecak *ibid*). Non-complementary control oligomeric compounds have no effect on HCV RNA or protein levels in this system. H8Ad17C cells will be treated with a range of concentration of oligomeric compounds shown in Table 4 above, especially SEQ ID NO: 16, (0-200 nm) in the presence of cationic lipids and

- 49 -

total protein levels will be evaluated 20 hours later by western blot analysis.

## PROCEDURE 6

### *In vivo* model for HCV

5     Animal models of HCV infection are not readily available. An alternative approach has been developed to evaluate antisense oligomeric compounds to inhibit HCV gene expression in livers of mice. For these experiments, HCV sequences, including SEQ ID NO: 15 target sequence, were  
10 fused to a luciferase reporter gene and inserted into a Vaccinia virus. Infection of mice with this recombinant vaccination virus results in quantifiable levels of luciferase in liver tissue. Potent phosphorothioate antisense oligomeric compounds have been shown to work in  
15 this model. SEQ ID NO: 16 (the 2'-O-DMAEOE RNA analog of SEQ ID NO: 15) will be evaluated for inhibition of expression of the HCV-luciferase construct in livers of mice infected with the recombinant vaccinia virus. Inhibition will be evaluated for sequence-dependency and dose response.  
20 HCV-luciferase expression in livers of mice infected with a control vaccinia virus vector lacking HCV target sequences will be used as control and the effect of antisense drug in these control systems will be evaluated. (Antisense oligonucleotide-mediated inhibition of hepatitis C virus  
25 gene expression in mouse liver (Anderson et al., Meeting Abstracts, International Hepatitis Meeting, Hawaii, 1997)).

## PROCEDURE 7

### *In vivo* nuclease resistance

The *in vivo* Nuclease Resistance of gapmers having the 2'-  
30 O-DMAEOE is studied in mouse plasma and tissues (kidney and liver). For this purpose, the C-raf oligonucleotide series SEQ ID NO: 17 will be used and the following five oligomeric

- 50 -

compounds listed in Table 5 below will be evaluated for their relative nuclease resistance.

		Table 5

## PROCEDURE 8

### Animal studies

For each oligonucleotide to be studied, 9 male BALB/c mice (Charles River, Wilmington, MA), weighing about 25 g are used (Crooke et al., *J. Pharmacol. Exp. Ther.*, 1996, 277, 923). Following a 1-week acclimation, the mice receive a single tail vein injection of oligonucleotide (5 mg/kg) administered in phosphate buffered saline (PBS), pH 7.0. The final concentration of oligonucleotide in the dosing solution is (5 mg/kg) for the PBS formulations. One retro-orbital bleed (either 0.25, 9.05, 2 or 4 post dose) and a terminal bleed (either 1, 3, 8 or 24 h post dose) is collected from each group. The terminal bleed (approximately 0.6-0.8 mL) is collected by cardiac puncture

- 51 -

following ketamine/xylazine anesthesia. The blood is transferred to an EDTA-coated collection tube and centrifuged to obtain plasma. At termination, the liver and kidneys will be collected from each mouse. Plasma and  
 5 tissues homogenates will be used for analysis for determination of intact oligonucleotide content by CGE. All samples will be immediately frozen on dry ice after collection and stored at -80°C until analysis.

**PROCEDURE 9**

10 The binding affinity as measured by T<sub>m</sub> was evaluated for oligomeric compounds having the 2'-O-[2-(2-N,N-dimethylaminoethyl)oxyethyl] modification. 5-methyl-2'-O-[2-(2-N,N-dimethylaminoethyl)oxyethyl] (modified T) was incorporated at selected positions in oligonucleotides and  
 15 binding was measured to complementary RNA oligomeric compounds.

10 aminoethyl)oxyethyl] modified.

The 2'-O-[2-(2-N,N-dimethylaminoethyl)oxyethyl]  
modified nucleosidic monomers show increased T<sub>m</sub> as compared  
to unmodified DNA as shown in Table 7.

Those skilled in the art will appreciate that numerous  
15 changes and modifications may be made to the preferred  
embodiments of the invention and that such changes and  
modifications may be made without departing from the spirit  
of the invention. It is therefore intended that the  
appended claims cover all such equivalent variations as fall  
20 within the true spirit and scope of the invention.

- 53 -

## WHAT IS CLAIMED IS:

1. An oligomeric compound having at least one nucleoside of the formula:

5 wherein

Bx is a heterocyclic base;

each  $R_1$  and  $R_2$  is, independently, H, a nitrogen protecting group, substituted or unsubstituted  $C_1$ - $C_{10}$  alkyl, substituted or unsubstituted  $C_2$ - $C_{10}$  alkenyl, substituted or  
 10 unsubstituted  $C_2$ - $C_{10}$  alkynyl, wherein said substitution is  $OR_3$ ,  $SR_3$ ,  $NH_3^+$ ,  $N(R_3)(R_4)$ , guanidino or acyl where said acyl is an acid, amide or an ester;

or  $R_1$  and  $R_2$ , together, are a nitrogen protecting group or are joined in a ring structure that optionally includes  
 15 an additional heteroatom selected from N and O; and

each  $R_3$  and  $R_4$  is, independently, H,  $C_1$ - $C_{10}$  alkyl, a nitrogen protecting group, or  $R_3$  and  $R_4$ , together, are a nitrogen protecting group;

or  $R_3$  and  $R_4$  are joined in a ring structure that  
 20 optionally includes an additional heteroatom selected from N and O.

2. The oligomeric compound of claim 1 wherein  $R_1$  is H,  $C_1$ - $C_{10}$  alkyl or  $C_1$ - $C_{10}$  substituted alkyl and  $R_2$  is  $C_1$ - $C_{10}$  substituted alkyl.

25 3. The oligomeric compound of claim 2 wherein  $R_1$  is  $C_1$ - $C_{10}$  alkyl.

- 54 -

4. The oligomeric compound of claim 2 wherein  $R_2$  is  $C_1-C_{10}$  substituted alkyl and the substituent is  $NH_3^+$  or  $N(R_3)(R_4)$ .

5. The oligomeric compound of claim 2 wherein  $R_1$  and  $R_2$  are both  $C_1-C_{10}$  substituted alkyl.

6. The oligomeric compound of claim 5 wherein said substituents are, independently,  $NH_3^+$  or  $N(R_3)(R_4)$ .

7. The oligomeric compound of claim 1 wherein  $R_1$  and  $R_2$  are each  $C_1-C_{10}$  alkyl.

8. The oligomeric compound of claim 1 wherein  $R_1$  and  $R_2$  are joined in a ring structure that can include at least one heteroatom selected from N and O.

9. The oligomeric compound of claim 8 wherein said ring structure is imidazole, piperidine, morpholine or a substituted piperazine.

10. The oligomeric compound of claim 9 wherein the substituent on said piperazine is  $C_1-C_{12}$  alkyl.

11. The oligomeric compound of claim 1 wherein said heterocyclic base is a purine or a pyrimidine.

12. The oligomeric compound of claim 11 wherein said heterocyclic base is adenine, cytosine, 5-methylcytosine, thymine, uracil, guanine or 2-aminoadenine.

13. The oligomeric compound of claim 1 comprising from about 5 to about 50 nucleosides.

- 55 -

14. The oligomeric compound of claim 1 comprising from about 8 to about 30 nucleosides.

15. The oligomeric compound of claim 1 comprising from about 15 to about 25 nucleosides.

5 16. A compound of the formula:

wherein:

Bx is a heterocyclic base;

10 T<sub>1</sub> and T<sub>2</sub>, independently, are OH, a protected hydroxyl, an activated phosphorus group, a reactive group for forming an internucleotide linkage, a nucleoside, a nucleotide, an oligonucleoside an oligonucleotide or a linkage to a solid support;

15 each R<sub>1</sub> and R<sub>2</sub> is, independently, H, a nitrogen protecting group, substituted or unsubstituted C<sub>1</sub>-C<sub>10</sub> alkyl, substituted or unsubstituted C<sub>2</sub>-C<sub>10</sub> alkenyl, substituted or unsubstituted C<sub>2</sub>-C<sub>10</sub> alkynyl, wherein said substitution is OR<sub>3</sub>, SR<sub>3</sub>, NH<sub>3</sub><sup>+</sup>, N(R<sub>3</sub>)(R<sub>4</sub>), guanidino or acyl where said acyl is  
20 an acid, amide or an ester;

or R<sub>1</sub> and R<sub>2</sub>, together, are a nitrogen protecting group or are joined in a ring structure that optionally includes an additional heteroatom selected from N and O; and

each R<sub>3</sub> and R<sub>4</sub> is, independently, H, C<sub>1</sub>-C<sub>10</sub> alkyl, a  
25 nitrogen protecting group, or R<sub>3</sub> and R<sub>4</sub>, together, are a nitrogen protecting group;

- 56 -

or  $R_3$  and  $R_4$  are joined in a ring structure that optionally includes an additional heteroatom selected from N and O.

17. The compound of claim 16 wherein  $R_1$  is H,  $C_1-C_{10}$  alkyl or  $C_1-C_{10}$  substituted alkyl and  $R_2$  is  $C_1-C_{10}$  substituted alkyl.

18. The compound of claim 17 wherein  $R_1$  is  $C_1-C_{10}$  alkyl.

19. The compound of claim 17 wherein  $R_2$  is  $C_1-C_{10}$  substituted alkyl and the substituent is  $NH_3^+$  or  $N(R_3)(R_4)$ .

20. The compound of claim 17 wherein  $R_1$  and  $R_2$  are both  $C_1-C_{10}$  substituted alkyl.

21. The compound of claim 20 wherein said substituents are, independently,  $NH_3^+$  or  $N(R_3)(R_4)$ .

22. The compound of claim 16 wherein  $R_1$  and  $R_2$  are each  $C_1-C_{10}$  alkyl.

23. The compound of claim 16 wherein  $R_1$  and  $R_2$  are joined in a ring structure that can include at least one heteroatom selected from N and O.

24. The compound of claim 23 wherein said ring structure is imidazole, piperidine, morpholine or a substituted piperazine.

25. The compound of claim 24 wherein said substituted piperazine is substituted with a  $C_1-C_{12}$  alkyl.

26. The compound of claim 25 wherein said heterocyclic base is a purine or a pyrimidine.

- 57 -

27. The compound of claim 26 wherein said heterocyclic base is adenine, cytosine, 5-methylcytosine, thymine, uracil, guanine or 2-aminoadenine.

28. The compound of claim 16 wherein  $T_1$  is a hydroxyl  
5 protecting group.

29. The compound of claim 16 wherein  $T_2$  is an activated phosphorus group or a connection to a solid support.

30. The compound of claim 29 wherein said solid support material is microparticles.

10 31. The compound of claim 29 wherein said solid support material is CPG.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US99/17895**A. CLASSIFICATION OF SUBJECT MATTER**

IPC(6) :C07H 21/04; C12Q 1/68

US CL :536/26.6, 24.3; 435/6

According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 536/26.6, 24.3; 435/6

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

APS, HCAPLUS, REGISTRY, DWPI

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
A	MESMAEKER et al. Antisense Oligonucleotides. Acc. Chem. Res. September 1995, Vol. 28, No. 9, pages 366-374, see entire document.	1-31

Further documents are listed in the continuation of Box C.

See patent family annex.

* Special categories of cited documents:	"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
*A* document defining the general state of the art which is not considered to be of particular relevance	"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
*E* earlier document published on or after the international filing date	"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
*L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	"&" document member of the same patent family
*O* document referring to an oral disclosure, use, exhibition or other means	
*P* document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

01 OCTOBER 1999

Date of mailing of the international search report

21 OCT 1999
